Environment Setting

DATA

How to get data

Gather data files from app store web page by crawling

DATA

Data files

Name	Details	Type
name	Application name	String
category	Application category	String
rating	Application score rated by users on a scale of 5	Float
review	The number of reviews	Int
price	Application price	String
content_rating	Age of use for applications	String

IMPLEMENTATION

Description

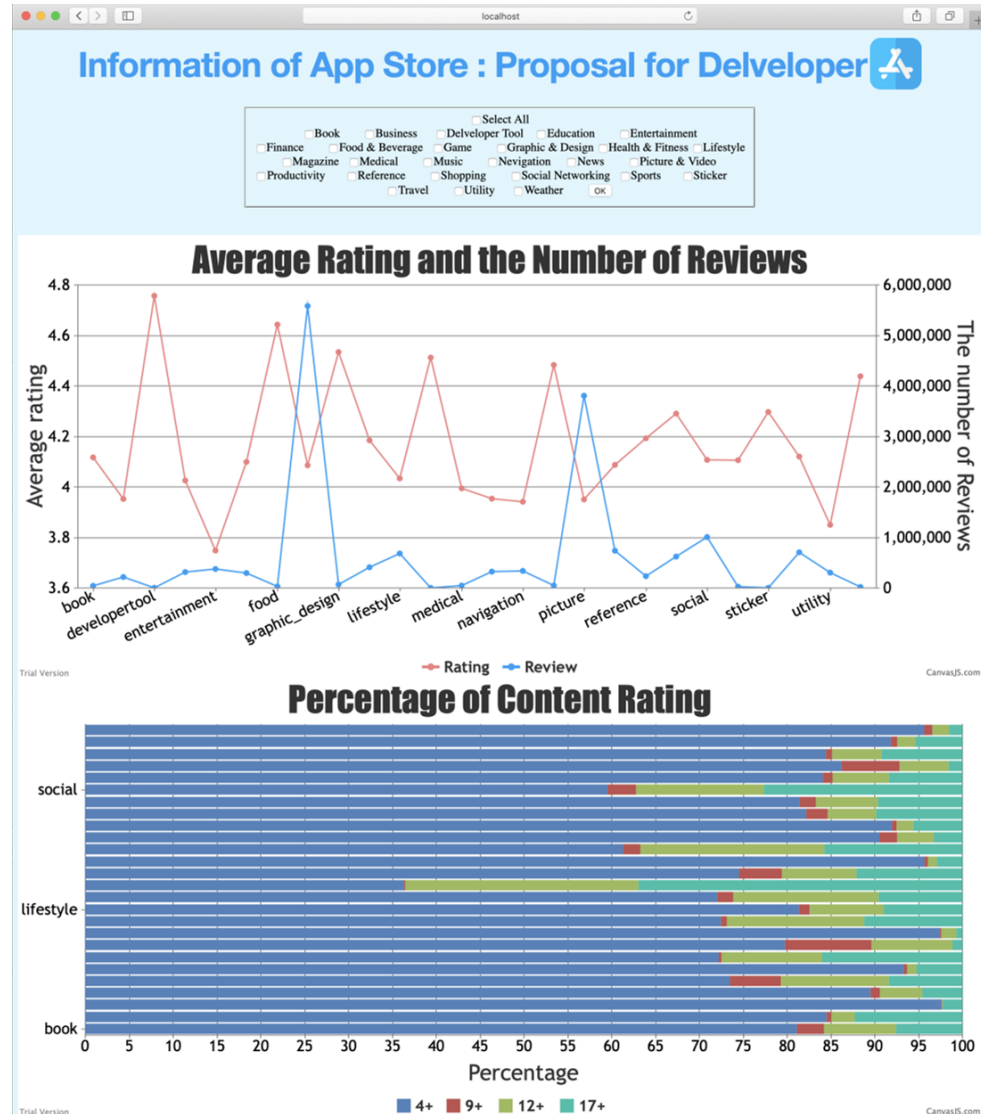

Description

[illegible]

```
<?php
    $q = $_POST["category"];
```

IMPLEMENTATION

Result

DEBUGGING

Debugging

Problem

Name	Details	Type
name	Application name	String
category	Application category	String
rating	Application score rated by users on a scale of 5	Float
review	The number of reviews	Int
price	Application price	String
content_rating	Age of use for applications	String
volume	Application volume	String

Volume information is collected **but never used**
→ Seems really inefficient

Solution

Name	Details	Type
name	Application name	String
category	Application category	String
rating	Application score rated by users on a scale of 5	Float
review	The number of reviews	Int
price	Application price	String
content_rating	Age of use for applications	String

Delete the **Volume** column

DEBUGGING

Debugging

Problem

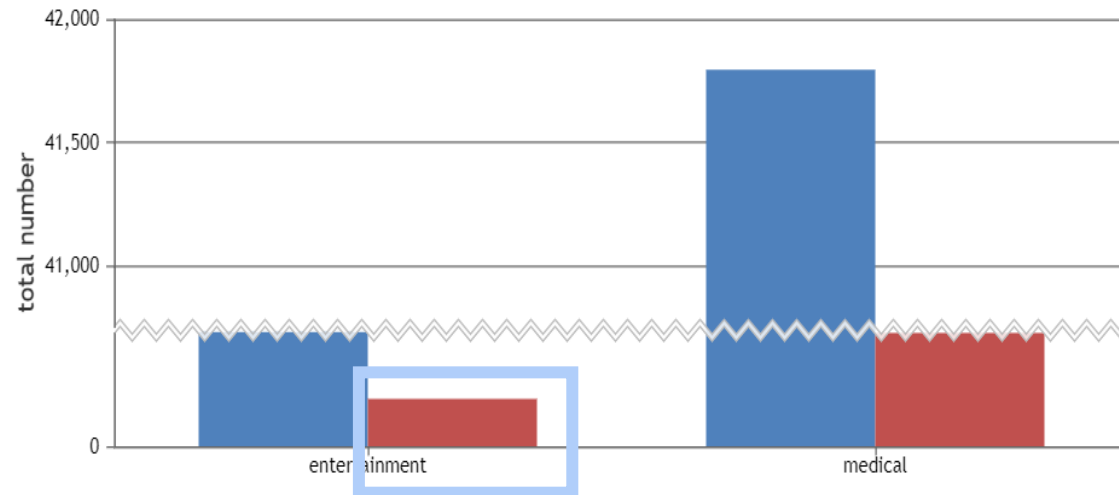

The Number of Reviews for Paid and Free App

The difference between two bars is **too high**
→ Hard to see the value

Solution

The Number of Reviews for Paid and Free App

Shrink down the bars by using quantile
to make the charts clearly

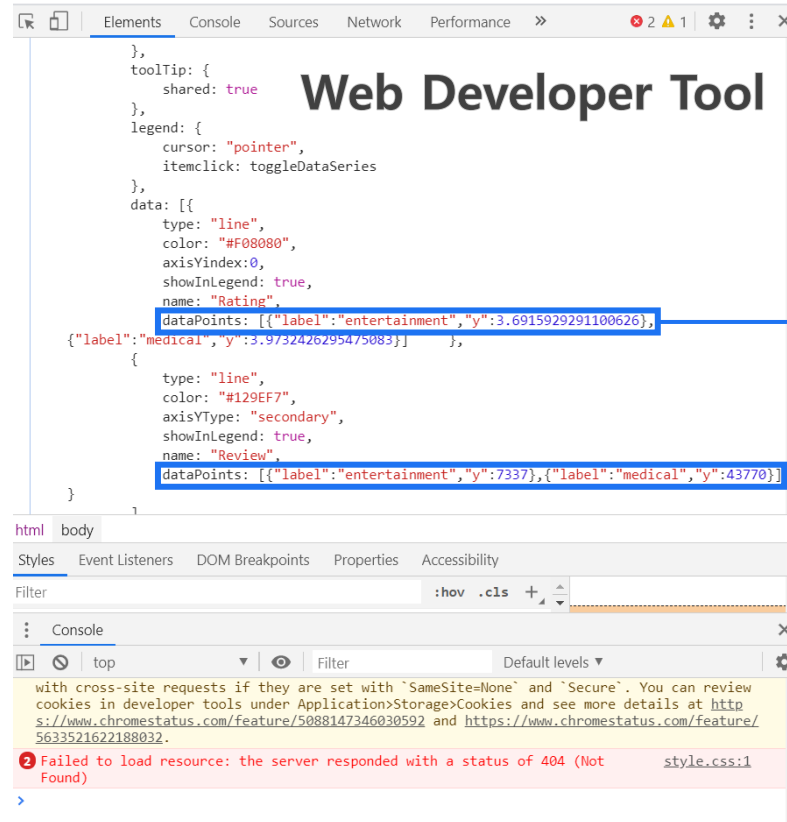

DEBUGGING

Debugging

Problem

In PHP Codes, it is hard to see the variables that are well allocated or not

Solution

Check the variables clearly
→ Can fix the wrong code partially

LIMITATION

Limitation

1. Data set change

Google Play

- Application information unrelated to Korea
- Old data (Data collected in 2015)
- Various available application information

- Use information related our country (Korea)
- Collect the data with crawling (Recent)
- Lack of some app information

2. Couldn't fully maximize use of Hadoop

APACHE Hadoop web connection failed
→ instead of it, we used dataset with **mysql**

3. Missing crawling file

Some crawling files are missed
→ But still have enough data

WORK DISTRIBUTION

16102268 Kim Yeong Hyeon

- Crawling app information about 7 categories
- With Hadoop, separated all collected Appstore information file

16102269 Kim Jong Gyu

- Crawling app information about 7 categories
- Making PHP file about the bar graph.
- Implementing the checkbox

18102076 Park Subin

- Crawling app information about 7 categories
- Making PHP file about pie chart, line graph.
- Integrate the all graphs

18102073 Kim Genie

- Crawling app information about 7 categories
- Making overall html design and powerpoint file

ENVIRONMENT SETTING

1. Create database 'projectDB'
2. Create tables for each category like the schema

Name	Type
name	String
category	String
rating	Float
review	Int
price	String
content_rating	String

Table names

book, business, developertool, education, entertainment, finance, food, game, graphic_design, fitness, lifestyle, magazine, medical, music, navigation, news, picture, productivity, reference ,shopping, social, sports, sticker, travel, utility, weather

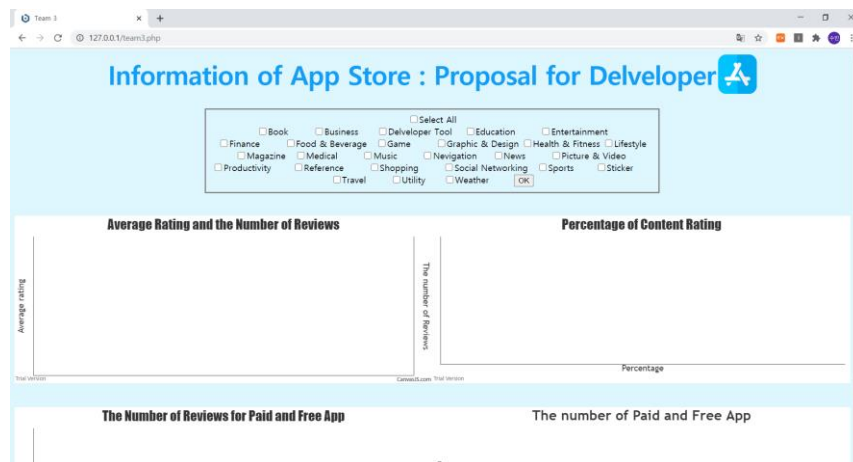

3. Load each text file to the table
4. Check the php file name (team3.php)

ENVIRONMENT SETTING

5. Using searching function, move to 'setting' part.
Change hostname, username, and pw same as yours

```
//setting
$hostname = 'localhost'; #Your host name
$username = 'root'; #Your user name
$pw = '-----'; #Your password
$db = 'projectDB';
```

6. Open 'hostname/team3.php' on your browser

THANK YOU!

감사합니다
